

Erizo 60

The **Erizo 60/ 100** is a universal Loader / Unloader with a wide range of uses in a PCB factory. The Erizos can be used as a **Loader** in front of any horizontal line or as an **Unloader** at the end of the line.

There are 2 versions of Erizo, Erizo 60 with a capacity of 60 panels and Erizo 100 with a capacity of 100 panels. The Erizo 60/100 can be equipped **with 1 conveyor or 2 conveyors** depending on the functionality and customer requirements.

The Erizo 60/100 can be used to Load or unload any kind of horizontal lines where panels **can be inner or outer layers**. In the case of Loading / Unloading inner layers, the Erizo will need to be **equipped with metallic bars** to support the panels in vertical position. On top of this, when metallic bars are installed, a conveyor will always be required. In case of using an Erizo to load or unload rigid panels or outer layers, the panels will slide into an aluminium profile with a U shape. In this case there will be no need for metallic bars.

These Units are equipped with a **touch screen with a friendly interface** together with a **PLC** offering **connectivity to the line** to be loaded or unloaded.
